**A Review of Essentials of Forensic Anthropology**

- MY. İscan 1980 Since 1971 forensic anthropology, a branch of biological anthropology, has become an established discipline within the American Academy of Forensic Sciences. Since its establishment the field has undergone two directions: the identification of group biology of humans in question and the identification of personal biology; the second type of identification being relatively new. Comparison of the present volume with previous publications on forensic anthropology: for example, Forensic Medicine and Forensic Science (1962) by Wilton M. Krogman (Spartanburg, SC), clearly indicates these developments.
